GPU Blosc: throughput / compression Pareto frontiers

NVIDIA L40 · nvCOMP 5.3 · driver 580.126.20 · sweep 2026-09-06 UTC

Per-codec frontier across block sizes + all shuffle modes. Higher and farther right is better.

Frontiers compare tested Blosc settings within each codec; both median throughput and compression fold are maximized.
Fold = padded chunk bytes / encoded bytes. Synthetic input and discard sink; GPU memory is not an objective here.
Lines join measured settings. Bars show observed spread, not confidence intervals.
Random panels zoom to the frontiers; off-scale candidates and raw controls are omitted.
